Volume 10 (30) Number 4

14th Annual Microscope Day at John Jay

Thursday, April 21st, 2016
“New” Building, 524 W. 59th St
New York, NY 10019
(Fifth floor, Room 5.67)

Presented by New York Microscopical Society and John Jay College

Please join us for this event, which begins at 10:00 AM and concludes at 3:00 PM. It is an informal event where speakers will give short presentations with ample time in-between to interact with other attendees and speakers.

This year's speakers and their presentation titles (exact times and order of speakers is subject to change):

10:00 Dr. Lawrence Kobilinsky, Chair, Department of Sciences, John Jay College – *Opening Remarks*

10:15 Dr. Jack Hietpas, FBI ORISE, “*The application of geochemistry and geochronology to forensic and intelligence problems*”

11:00 Detective Greg DiCostanzo, Firearms Analysis Section, NYPD Forensic Investigation Division, “*The John Lennon Shooting*”

12:00 **Lunch Break and mingling with the exhibitors**

1:00 Adam Hartley, Forensic Evidence Inc, “*The Boy Scout, the Hustler, and the Porn Queen*”

1:30 Dr. Jennifer Rosati, University of Windsor, Ontario and John Jay College, “*The evolution of genitalia in insects and its importance in the identification of forensically-related species*”

2:00 Cindy Vitale, Senior Forensic Chemist, DEA Northeast Laboratory, “*Microscopy in Drug Analysis*”

2:30 Last opportunity to mingle with the exhibitors

3:00 Peter Diaczuk, New York Microscopical Society / John Jay College - *Closing remarks*

Exhibitors: Several firms dealing with microscopes and microscope accessories have graciously agreed to set up exhibits of their products for the day.

Refreshments to be served. This event is free and open to all those interested in microscopy
Photo ID necessary for entry into building

Board of Managers

- President, 2015-16** Angela Klaus klausang@shu.edu; (973)761-1840, Manager 2015-18
- Vice President, 2015-2016** John Scott nyconsnfdn@aol.com; (646)339-6566, Manager 2015-18, Program Chair
- Treasurer, 2015-2016** Mel Pollinger pollingmel@optonline.net; (201)791-9826, Manager 2014-17 Facilities, Editor
- Secretary, 2015-2018** Lou Sorkin entsult@aol.com; (914)939-0917 Manager, 2015-18, Webmaster Pro tem
- Manager, 2015-2018** Guy deBaere guydbaere@aol.com; (347)668-4798 Outreach Program
- Manager, 2015-2018** John A. Reffner jareffner@cs.com; (203)358-4539 Past President
- Manager, 2014-2017** John R. Reffner, Jr. jrr11p@gmail.com; (215)527-1882
- Manager, 2013-2016** Roland Scal rscal@qcc.cuny.edu; (718)631-6071
- Manager, 2014-2017** Andrew J. Winter andrew.winter@co.middlesex.nj.us; (732)816-3793, Education Chair
- Manager, 2013-2016** Brooke Kammrath bkammrath@newhaven.edu; (203)931-2989, Membership Chair
- Manager, 2013-2016** Seymour Perlowitz perlowitzs@hotmail.com; (718)338-6695
- Manager, 2013-2016** Peter Diaczuk peter.diaczuk@gmail.com; (212)237-8896, Past President

Dues and Addresses

Please remember to mail in your Dues to:

Mel Pollinger
Treasurer, NYMS
18-04 Hillery St.
Fair Lawn, NJ 07410-5207

- Junior (under age 18) \$10 Annually
 - Regular \$30
 - Student (age 18 or above) \$20 Annually
 - Supporting \$60 Annually
 - Corporate (includes one advertisement in NYMS News) \$175 Annually
 - Life \$300 (payable within the year)
- To avoid missing notices:
Notify Mel Pollinger if you have changed your address, phone or email.

Awards Given by the New York Microscopical Society

The New York microscopical Society takes great pleasure in recognizing and rewarding individuals who have contributed to either the activities of the society or to furthering microscopy. These awards are described in our website and in a pdf file for our email newsletter recipients. All members are eligible to nominate individuals for these various awards, and are encouraged to do so. John A. Reffner, Awards Committee Chairperson

Awards Committee

Chair: John A. Reffner

Members

- Jan Hinsch
- Peter Diaczuk
- Angela Klaus
- John R. Reffner

Mel Pollinger, Editor

Fair Lawn, NJ 07410-5207

To Order Your NYMS Lapel Pins

Send a check in the amount of \$12.00 per pin to:
New York Microscopical Society
c/o Mel Pollinger, 18-04 Hillery Street, Fair Lawn, NJ 07410. To avoid shipping & handling charges, pins may be purchased directly at any NYMS meeting for \$10.00.

Please remember to pay your dues

Buy and Read a Good Book on Microscopy.

The Mission of the New York Microscopical Society is the promotion of theoretical and applied microscopy and the promotion of education and interest in all phases of microscopy.

Alternate Meeting Notifications
Please note that due to time constraints in publishing, some meeting notices may be available by calling Mel Pollinger at 201-791-9826, or emailing: pollingmel@optonline.net

New sale item:
Rotifers By former
NYMS member,
The late Howard
L. Taylor. 73
pages of text and
detailed drawings.
Workbook style
binding. Should be
on every
member's book
shelf. Limited
supply.

What's Happening this Spring/Summer 2016

- April: Microscope Day at John Jay Collage.
- Meeting at Salmagundi Society
- SCONYC events
- Nature-photo Walk in NJ Meadowlands (tentative)
- Open Microscope Lab days at NYMS
- Nature/collecting hike on Ramapo Forest Reserve in Oakland, NJ, (Tentative)
- Micromineral adventure at NYMS (mineral micromounts, sands, etc.) Tentative
- Members may request additional events for Spring & Summer

Buy from NYMS

Magazines, NYMS Year Books, etc.

Many magazines, NYMS Year Books, etc., are available to our members to view and also purchase. If you are interested in owning some history of the New York Microscopical Society, contact Mel Pollinger by email, or phone (see page 2).

McCrone Courses

Call or write for course information:
McCrone Research Institute: 2820 S.
Michigan Avenue, Chicago IL 60616-3230
Phone: 312-842-7100

I was asked to review a new microscope; I said I would look into it.

Stentor – Wikipedia

Stentor, sometimes called **trumpet animalcules**, are a [genus](#) of filter-feeding, [heterotrophic ciliate protists](#), representative of the [heterotrichs](#). They are usually horn-shaped, and reach lengths of two millimeters; as such, they are among the biggest known extant [unicellular](#) organisms. They reproduce asexually through binary fission.

The body, or [cortex](#), is generally horn-shaped, hence the association with the [Greek herald](#) and the former name "trumpet animalcule", with a ring of prominent [cilia](#) around the anterior "bell" that sweep in food and aid in swimming. Some reach several millimeters in length, making them among the largest [single celled organisms](#). Stentor can come in different colors. For example, *S. coeruleus* can appear blue due to the presence of Stentorin, a natural pigment. As in many freshwater protozoans, Stentor has a [contractile vacuole](#). Because the concentration of salt inside the cell and in the surrounding freshwater is different, Stentor must store water that enters it by [osmosis](#) and then discharge it from the vacuole. They can [regenerate](#), and small fragments can grow into full organisms. Each cell has one (often elongated) [macronucleus](#) and several [micronuclei](#).

Be A Volunteer – There's Always Something to do and see at NYMS.

If you wish to contribute some of your time to NYMS, please contact me at (201) 791-9826 or by email at pollingmel@optonline.net

Visitors Always Welcome to NYMS

Although most of our lecture meetings, workshops and classes are held in the NYMS Clifton facility on the last Sunday of the month, the building may be opened for special purposes at other times, by appointment only. For such an appointment, please contact Mel Pollinger by phone at (201) 791-9826, M-F noon to 9:30pm, or by email at pollingmel@optonline.net.

From The Editor...

if you have an email address: Getting the newsletter by email means you can receive an **extended pdf version** that cannot be sent by "snail mail." Even if you only continue your USPS delivery of the newsletter, NYMS needs your email address for reporting priority events and special news. Being able to contact you quickly by email means better communication between you & NYMS■ Mel

Need to use a Microscope?

The various microscopes that are presently set up on the main floor of the New York Microscopical Society building in Clifton, N.J. are there for the use of its members.

Check out [The Secret World Inside You at the American Museum of Natural History](#) open till August 14, 2016!

Microscope Cleaning Kit

A complete set of tools and accessories to keep your microscope in optimum operating condition. The kit is put together by our previous Curator/Educational Chairman, Don O'Leary, and available directly from NYMS, while they last, for only \$40.00 plus shipping & handling, or may be purchased at a meeting. Call or email Mel Pollinger for details (see page two for contact numbers).

NYMS Meeting Dates

Most meetings of NYMS are usually held in Clifton on the last Sunday of the months of Jan., Feb., Mar., May, Sep., Oct. Exceptions will be noted in the Newsletter.

NYMS microscope slide collections are available for study at meetings and by appointment.

Please be aware that our website is continuously updated.

Answer to Mystery Photo for Mar 2016

Meteorite polished surface: 50x, Nomarski Incident Light D.I.C. – Did you guess correctly?
J. Terry Fisk did!

Mystery Photo for Apr 2016

Want to take a guess? Send it to me by email or call me: pollingmel@optonline.net, (201) 791-9826

Additional Historical NYMS Supplements

Email Newsletter recipients can also receive copies of NYMS Newsletter pdf back-Issues from 2007. Copies of older newsletters will be included in the supplement section as I convert them.

Attention NYMS Members

Got something to sell? Article to publish? Pictures for the newsletter? Looking to buy something? Want to use the library? Want to use a NYMS microscope? For any of the above, contact the Editor, Mel Pollinger.

Folded-Optics

Folded-Optics Microscopes

R. Jordan Kreindler (USA)

Figure 1. McArthur folded-optics microscope, made by Vickers Instruments, Ltd. England.
(In case, approximate size: 11cm x 7cm x 6cm; weight: 1 pound, 5.6 ounces). Post 1963

Folded Optics Microscopes

At the beginning of the 1930s a seminal, and for field microscopes a "sea change", event took place. Dr. John Norrie McArthur (1901-1996) invented and produced the prototype of his first folded-optics microscopes. He discussed his microscope before the Quekett Microscopical Club in 1933. McArthur's name is now synonymous with his folded-optics microscope. This seems fully appropriate considering his importance in the evolution of portable field microscopes.

His compact instrument was approximately 10 cm x 6.5 cm x 5.0 cm. During WW II, Dr. McArthur was captured by the Japanese in Borneo, but allowed to continue his research by Japan's chief civilian administrator for Borneo, Tatsuo Inagawa-san. This freedom allowed Dr. McArthur a chance to use his newly designed microscope. This experience suggested to Dr. McArthur that some important changes to his original folded-optics design were needed. He made these changes at the war's conclusion. (Kreindler, 2011-2)

Folded-optics microscopes can trace their lineage directly back to the seminal work of Dr. John Norrie McArthur, begun in the 1930s. According to the 1974 Guinness Book of Records, Dr. McArthur's microscope was the world's smallest high power microscope. (Saitoh, 2006).

Mr. Saitoh was a Japanese physicist who was fortunate enough to meet Dr. McArthur in 1972/73 and then a decade later in 1982/83. The following is from Mr. Saitoh's personal account, with minor English corrections by the author, as told to Mr. Saitoh by Dr. McArthur,

I was studying malaria in Borneo, and was captured and confined in a camp by the Japanese army during World War II. Fortunately, however, Mr. Inagawa, a high ranking officer of the army administration, understood the importance of the research, and encouraged me to continue. He provided me with supporting money for research and even milk for my baby, under the difficult circumstances of getting foods.

During my research, I desperately felt the need for a portable microscope usable in fields and under the kerosene lamp in a tent. After my release from imprisonment, I started developing compact microscopes with full versatility suitable for research. I am currently very busy in pursuing the ultimate design of models of various types, including the surface inspection model, to my complete satisfaction. (Saitoh, 2006).

Figure 2. Plastic body McArthur microscope made for the Open University (OU), c. 1970s

The ubiquitous Open University (OU) McArthur microscope, Figs 2 and 3, perhaps best exemplifies McArthur's folded optics design. This microscope was made by Scientific Optics Ltd., Ponswood Industrial Estate, Hasting, Sussex England, for the OU; it was adapted for this use under Dr. McArthur's guidance. Traditional McArthurs (e.g., Figs. 1 and 4) are made of metal, and their cost was prohibitive for many users and uses. The unique OU McArthur microscope was made of plastic (acrylonitrile butadiene styrene) and was, relatively, inexpensive to manufacture.

However, using inexpensive construction materials has had its effects on long-term durability. Now, decades later, many of the OU McArthurs show a significant loss, if not complete lack, of functionality. However, in spite of the, arguably, substandard construction material, particularly in making the objectives slider, possibly the instrument's "Achilles heel", many OU McArthurs are still in use. This probably demonstrates the general robustness of McArthur's design, even when less desirable construction materials are used. Many OU models have been converted to use AAA batteries and LED illumination, as the original battery compartment was too narrow to accommodate AAAs without modification.

Note the warning in Fig. 2, to "SLACKEN Focus screw after use". This screw was used to focus the instrument by flexing the objectives carrier. If left tightened, the plastic can lose its flexibility and fixed in place would be non-useable for focusing. This is one reason many OU models are now non-functional, and why the objective slider is likely the "weakest link" in the microscope's design.

Figure 3. The folded-optical path in an OU McArthur microscope

As can be seen in Fig. 3, external light entering the McArthur is "folded" (reflected) through three right angles. It is first reflected downward to a second reflector, where it is transmitted across the base of the microscope to another reflector, and then reflected upward into the eyepiece. A slider can be moved so that the external light source is replaced by illumination from an internal light, e.g., lamp, or LED if modified.

Objects are seen "upside down" compared to conventional microscopes. The object to be viewed faces downward, as in an inverted microscope, rather than upwards toward the eyepiece. Because of this "inverted" nature of the microscope, only a single fine focus is needed, as the

object viewed will always rest on top of the platform, i.e., at an almost constant distance from the top of an objective.

Mr. Walker (Walker, 2013) bought a McArthur microscope directly from Dr. McArthur in August 1968, for GBP 90. It had 10/40/100 objectives. Mr. Walker also said,

At that time, I remember, John told me that he had become so dissatisfied with the sales efforts of Cooke, Troughton & Simms that he had bought up their entire remaining stock of his microscope and was selling it 'himself'. I have no idea who took over its manufacture after that ...

In less expensive McArthurs, as in some recent SLR cameras, and many folded-optics descendants, e.g., the FM-31, mirrors are used in place of prisms to reduce manufacturing costs.

Figure 4. McArthur microscope with objectives, by Vickers, Meopta and Cooke. Its stage is located on the top, and it has sub-lens illumination.

Photomicrographer Spike Walker (Walker, 2013) was kind enough to provide the author with his following recollections about Dr. McArthur. [Author's note: What follows is a compilation from a number of emails received by the author from Mr. Walker.]

... I knew John McArthur very well from the mid 1960s onwards: he used to stay at our house in Stoke-on-Trent from time to time, and my ex-wife and myself once stayed in the caravan behind his cottage (one 'room' of which was a workshop where he worked out new ideas) in the Cambridgeshire fens. He last visited me in the early '90s but, although he recognized me, he was becoming rather confused by then. His microscope was his obsession. If he were designing a new attachment, he would carry the adapted instrument around in his hand and, if it did not 'feel' right, it was back to the drawing board.

His prototypes were machined by a car mechanic in a garage outside Cambridge. This craftsman was in demand by Cambridge University research departments, so much so that John told me that he had to get there very early in the morning to make sure he was at the head of the 'queue'!

I was sometimes surprised by his lack of understanding of optics. For example, when he was planning to adapt the microscope for blue-light fluorescence, he had me drawing a diagram to show him where the small tungsten-halogen lamp needed to be situated for maximum effect!

He was a most charming man (my ex-wife used to say that he could "charm ducks off water"). He, for instance, once turned up at the house carrying a bunch of primroses, which he had picked at the roadside for her. He had a particular passion for cornflakes. He once told me that, before the Japanese invasion, he used to sit and eat his breakfast (cornflakes no doubt) in the garden of their bungalow which was perched high above an estuary frequented by sea-going crocodiles. On the table would be a 'broom-handle' Mauser semi-automatic pistol which he used, between mouthfuls, to take pot-shots at the crocs.

One morning in 1969, while we were at his cottage, he suggested we have breakfast in the garden and out came the table and chairs, tablecloth, plate, cutlery and a Webley air pistol. I do not think that my wife and I made any comment but just sat and waited to see what would happen. He loaded the gun, started to munch his cornflakes, and then carefully aimed it at one of the ventilators on the roof of the pig farm across the way and fired. "Plus Ça change....."

... John was never satisfied with the efforts of the companies who were entrusted with the task of manufacturing his 'baby' and always managed to fall out with them, sometimes terminally!

He remains the only person I have met who claimed to have eaten human flesh! He told me that it occurred (before the arrival of the Japanese) during the festivities associated with the wedding of a child of a local chief. As John [along with another] were the honored guests, they were served with food by the chief himself. After the meal, John congratulated him on the excellence of the pork, to be told that it was actually someone from a neighboring village. The conversation may have occurred in 1989, but it is not something that it is easy to forget!

In order to keep himself sane during his time as a prisoner, he began covertly to write an encyclopaedia of microscopy, on whatever scraps of paper (wrapping paper, labels from tins etc.) he could scrounge. Unfortunately the camp was bombed and the remains of the book were finally recovered from the bottom of a water-filled crater. John actually showed me what remained, [it was] a wad of compressed pieces of muddy brown paper, like half-finished tobacco.

He was a very handsome man - with his white wavy hair and goatee beard: so much is evident in photographs of him, but he also had a very attractive lisp-like impediment, which my ex-wife thought devastating.

John once showed me the prototype of his microscope which he constructed as a student and which he said he used to 'revise' Histology slides while travelling between his home and university department 'upstairs' on an open-topped London bus. It was made from a block of wood of the approximate size and shape of the familiar instrument, bored through to take x40 objective, an eyepiece and two 90 degree prisms, the latter obtained from an 'ex-War Dept.' store. There was no condenser.

From what I can remember, the objective was fitted in an RMS-threaded ring but have no recollection of the means of focusing it. In any case, I imagine that John must have published these details because he was very proud of his invention. He had a fitted case in which he

carried the microscope and all its accessories and delighted in dismantling the instrument and reassembling it in its various guises with such dexterity that he reminded me of an armourer field-stripping a submachine gun.

John was convinced that the microscope could be of immense value to medical workers in inaccessible areas in the tropics, allowing them to examine blood samples for blood parasites 'in the field'. Not only was its extreme portability an issue, it could he thought, be easily dropped in from a low-flying aircraft without a parachute if suitably wrapped in foam rubber and fitted with a brightly-coloured 'streamer' for visibility. I seem to remember his mentioning that a 'feasibility study' was actually carried out over an airfield but he certainly tried it out by dropping it from the window of a flat in a multi-story block.

...

His son from his first marriage, took one of the microscopes on a British Schools Exploring Society expedition ... sometime in the 1950s ... one was carried on an expedition to the Antarctic. It was later fitted with a plate commemorating the event. (A photo of a bearded explorer using it was the illustration on the cover of a brochure about the instrument.) McArthur's folded-optics design spawned a number of descendants. These include the Nikon H, Fig. 5, (Nikon, 2013). Dr. McArthur, tried to get Nikon interested in his microscope. He discussed the project with some very senior Nikon executives but they showed no interest. However, a year-or-two later, one of Nikon's own miniature microscopes arrived in the post. (Walker, 2013).

Figure 5. Nikon H folded-optics microscope, c. 1960s

These spawned microscopes include the TWX-1, Fig. 6, (Kreindler, 2011-2), as well as Tiyoda Models VI and VII, and.

Figure 6. TWX-1, c. mid-1970s

the Swift FM-31, Fig. 7,

Figure 7. Swift FM-31 with Maglite[®] illumination c. 1980s

and its clones, Fig. 8, (Kreindler, 2011-1).

Figure 8. Current FM-31 clone with attachable illuminator, stored in original packing Styrofoam

These descendants also include the folded-optics implementations of Keith Dunning and Rick Dickinson, such as the Lensman, Enhelion Micron, Meade ReadView, Trekker, and the Newton microscopes (the Newtons are discussed in detail in the second Part of this paper). To date, these Newton folded-optics microscopes include the Nm1-400, Nm1-400 XY, Nm1-600, Nm1600 XY,

and Nm1-1000 XY. Newton microscopes were originally marketed by Cambridge Optronics, but the name of the marketing/sales arm for Newton microscopes recently changed to "Newton microscopes" to avoid confusion. Cambridge Optronics will remain as a holding company, but "Newton microscopes" will be the public face of Cambridge Optronics for Newton microscopes.

The following table provides summary information on the folded-optics microscopes developed by Messrs. Dickinson and Dunning (Dickinson, 2013).

Table 1

<u>Name</u>	<u>Launch Date</u>	<u>Sales Date</u>	<u>~ Number Sold</u>	<u>Manufacturing Loc.</u>	<u>Launch Price</u>
Lensman	1988	1989	7,000	UK	£99
Enhelion Micron	Modified Lensman	2001	4,500	China	£99
Meade ReadiView	Modified Lensman	2003	5,000	China	£ 90
Trekker	2003	2004	7,400	China	£ 49
<i>Newton Microscopes</i>					
Nm1-400	2013	2013	n/a	China	£ 412.50
Nm1-400 XY	2013	2013	n/a	China	£ 492.46
Nm1-600	2013	2013	n/a	China	£ 497
Nm1-600 XY	2013	2013	n/a	China	£ 579.96
Nm1-1000 XY	2011	2013	n/a	China	£ 607.46
Newton Fluorescence	unk	unk	n/a	China	est. £7-800

Pictures and brief discussions of the Lensman, Enhelion Micron, Meade ReadView, and Trekker are provided below. These microscopes were designed as relatively inexpensive, highly portable instruments that could be carried into the field, and they met these goals quite well. They were not designed to meet demanding scientific requirements. Although they can be used for initial screening, further definitive, detailed analyses requires a higher quality microscope with greater resolution. The Lensman and its derivatives are unique in using 3D folding, instead of the usual 2D folding found in most other folded-optics McArthur derivatives. They use a third reflective surface to fold (bend) the light in the z-dimension. These unique designs allow for a relatively large stage that is unencumbered by intrusions, and thus provide room for a removable ring magnet, visible in Figs. 11 and 12, to hold slides to a metal stage.

The Lensman, and its cohorts

The Lensman, Fig. 9, is roughly 4" in diameter; it was sold by Science of Cambridge, Cambridgeshire. It offers two magnifications, 80x and 200x. However, as with the Enhelion Micron discussed below, changing magnifications requires refocusing, as the dual magnification is achieved by moving a Barlow lens into the optical path.

Figure 9. The Lensman original concept.
Illustration courtesy, and with permission, of
Rick Dickinson

The optics for the Lensman were designed by UK optical designer Eddie Judd. In addition to dual magnification options, there are dual selectable illumination settings. The collapsible arm contains the bulb, which is powered by two AA batteries located in the saucer like section of the microscope, and accessible from beneath, Fig.9.

Mr. Walker had personal recollections about the company that produced Lensman and particularly the "Micropage", (Walker, 2013).

I myself got involved with the Lensmen by being asked to produce the photomicrographs and notes for a 'Micropage' (which never materialised on Protista and other freshwater organisms) [Author: see below for more details on the 'Micropage']. Unfortunately, the company ran out of money before I could be paid all they owed me, but I had a great deal of respect and admiration for them.

They had boundless enthusiasm for the project and thoroughly deserved to succeed, but there was the feeling that the 'minor' optical manufacturers with whom they might have competed 'ganged up' on them.

I must admit to having been doubtful as to the practicality of producing a 'Micropage' of photomicrographs of sufficient resolution to be useful in identification. The proposed method was to paste the necessary number of small prints onto a large sheet of cardboard, photograph them on 5 x 4 and then reduce the resulting transparency. I persuaded a local film-processor to produce the prints.

However, perhaps not unexpectedly, Dr. McArthur was not pleased with the Lensman. Mr. Walker (Walker 2013) notes,

John could be very pig-headed. He disliked the OU instrument for its lack of precision and its feel, and detested the Lensman (author, see below) to such an extent that he totally refused to help in its design

Mike Dingley (Dingley, 1998), commented that the

... quality of the images [author: from the Lensman] are at best reasonable but not good enough to take photomicrographs ...".

M. A. Beale (Beale, 1991) says that,

The Lensman is not a high-resolution piece of equipment, and consequently the images seen are poorer than with conventional microscopes. Focusing is rather difficult because the focus wheel is not locked tightly into place: when pressure is applied to the wheel, the image clicks out of view. ... At present the Lensman is an educational toy, and it has little value as a teaching aid.

S. B. Coghill (Coghill, 1992) observed,

The experience of using the Lensman microscope for 1 year indicates that this inexpensive, pocket-sized instrument, which can be used at the bedside or in the outpatient department, can assess the quality of needle aspirates although it is not suitable for making definitive cytological diagnoses.

In spite of some negative appraisals, the Lensman was unique. It met its limited goals, and garnered a number of awards. These included the 1990 Prince of Wales Design Award, the 1990 BBC Award, the 1991 Archimedes Award, and the 1991 Camera of the Year Award, in the accessories category.

The Lensman could be purchased as a package with three slides, a 26 page booklet (the instruction manual was written by Professor Brian Ford), an instruction poster, and material on butterflies and moths, and other insects. This material was presented on microfiche, hence the square field of view. The use of microfiche (called micropage in Lensman "speak") was felt to make it easier for identification in the field without the need to carry field identification books.

However, this use of microfiche never caught on.

Perhaps, this was simply not an appropriate approach, or it may have been due to the rapid advances in electronic imaging that made microfiche seem "old-fashioned".

Figure 10. Lensman microfiche (micropage) used for field identification. Courtesy, and with permission of Rick Dickinson

Whatever the reason, the microfiche identification guides did not continue into subsequent microscope models. However, the more expensive square viewing format did persist, probably for its benefits to photography, and possibly the value of not having to retool. The numerical aperture (NA) for the Lensman and its derivatives is thought to range between 0.10 to 0.12.

A green colored ("Green Lensman") was made for the natural History Museum, London (Flickr, undated-1).

The Enhelion Micron

The Enhelion Pro 160's one sheet guide in introducing the Micron states,

The Micron range of microscopes, designed and produced by Enhelion is a radical and innovative departure from microscope convention. They are designed with portability and ease of use as a priority offering a compact and versatile instrument solution with an extremely wide range of applications. ... (Enhelion, 2002)

Fig. 11 shows the Enhelion Micron in its storage case, in front of its retail box. This microscope provides both 80x and 160x magnifications, accessible via a knurled, rotating knob. However, the two magnifications still required re-focusing owing again to the use of a Barlow lens, i.e., they were not parfocal. The Micron uses two AA batteries for illumination. This is a light, highly portable instrument weighing, in its case, approximately 12.8 ounces. My microscope kit came with two slides: a somewhat amateurishly prepared slide of a "Butterfly Leg", and a clear shallow well slide. This microscope has a "Nextel" paint finish, and laser etched graphics.

The Meade ReadView

Meade ReadView's single user instruction sheet says the following,

ReadView (Fig. 12) is a radical new microscope design. Designed for portability and ease of use. ReadView is highly versatile and can fulfill a wide range of applications. ReadView provides two magnifications levels, 80x and 160x. ... The eyepiece may be removed (just gently pulled from the body of the microscope) and be used as a 10x viewer (Fig. 13).

ReadView has a lighting arm, which conveniently folds down and out of the way for storage. Power for the lighting arm is provided by two user-supplied AA-size batteries. Included with [the] kit is a magnetic holder to secure your slides or specimens in place, plus two slides: one prepared with a specimen and one left blank so you can prepare your own specimens.

Enhelion was contacted by Meade to see if they would be interested in making the Enhelion Micron Pro 160 for Meade, with the "new" product marketed under Meade's name. Enhelion

agreed. The primary change from the Enhelion model was the introduction of LED illumination, then under development for the Trekker (see below).

There were also some small cosmetic modifications such as the color of the microscope's outside diameter band and eyecup, the Readiview name radiating inward toward the origin of the microscope's circle, and the Meade name on the circumference. A newly designed retail box and new instructions were produced by Meade. The Readiview microscope was produced for Meade by Enhelion, in the same Chinese facility where the Micron was produced.

The Meade Readiview, as noted, is a slight modification of the Enhelion Micron, which in turn was a slight modification of the original Lensman. This microscope, as the one discussed above, comes with a prepared slide of a "Butterfly Leg", and a clear shallow well slide. Although, relatively inexpensive, the optics are glass not plastic. The Readiview's appearance is similar to that of the Enhelion Micron, Figs. 11 and 12.

Mr. Dickinson was kind enough to provide the following additional information (very slightly reformatted by the author) concerning the Lensman, Enhelion Micron, and Readiview.

- *All came from the same tooling.*
- *All had the same square field of view.*
- *All have an internal polished metal reflector to direct illumination upwards for solids viewing when the lighting arm is in the down position and illumination left on. (This aspect seems to be often missed, and was a useful function for hobbyists.) □ Slightly angling the lighting arm can introduce dark ground illumination effects.*
- *All microscopes had pull out eyepieces, allowing them to be used as a 10x loupe.*
- *To save cost on the optics, mechanisms, and space, all had a single objective lens and the dual magnification was achieved by swiveling a Barlow lens into the optic path. This is also why the two magnifications were not parfocal.*
- *All instruments were supplied with a molded magnetic ring to hold down specimens or slides on their ferrous (magnetic attractive) stages.*

--- (Dickinson, 2013)

Figure 11. Enhelion Micron

Figure 12. Meade Readiview handheld microscope

The Trekker

The Trekker, Fig. 14, was purchased in a see-through case, with the eyetube of the microscope extended to the graphics on the box. It comes with an attractive drawstring, gray and yellow cloth

Figure 13. Readiview eyepiece removed for use as a 10x magnifier

pouch case, approximately 6-1/2" x 4". A hard-sided carrying (storage) case is also available. That case is similar to those provided for the Lensman derivatives discussed above. The author's new Trekker came with a prepared "Feather" slide.

One small, but meaningful, change was to the magnetic slide holder, which now had a matte aluminum-toned finish, making it harder to lose in the field.

The following comes from the back of the Trekker retail box,

- *High resolution coated glass optics*
- *Views solid and transparent objects and fluids*
- *Magnifies x35 and x10*
- *Unique square field of view*

The 10x specification, although accurate, may be somewhat misleading. This magnification is not obtained through the compound microscope, but by removing the eyepiece and using it as a separate magnifier. While handy, a separate 10x magnifier would be smaller, and provide more flexibility and usability than the removed eyepiece.

The approximate weight for the microscope with slide holder, retail box, and cloth case is 10.2 ounces. The Trekker with only the magnetic holder weighs approximately 6.2 ounces. The hardsided case adds an additional 6 ounces.

In this foursome of folded-optics microscopes, the Trekker is somewhat the "odd man out". While it contains some parts from the Lensman family, it was/is an essentially newly produced variation of the Lensman. The re-tooling was funded out of an upfront royalty payment from Meade. Owing to the lower magnification, i.e., 35x, the lighting arm present on the earlier three models was no longer needed. Rather a daylight temperature, white light LED is placed inside the body to illuminate solid objects, when appropriate, from the side. In some instances, this LED placement can show more object detail, although occasionally at the expense of not adequately illuminating object areas with relatively deep cavities. The object viewing circle is surrounded by a transparent acrylic ring to diffuse the LED light more widely.

The LED illumination required a different voltage than the earlier lamp's AA batteries, so provisions for a standard rectangular 9-volt battery were provided for in the battery compartment on the underside of the microscope, Fig. 15. Using a quality battery, illumination should be available for almost two weeks of continuous 8 hour/day use, without the need to change batteries.

In June 2005, David Walker evaluated the Trekker microscope for Micscape Magazine, after purchasing a new one for about 30 GBPs on eBay UK.

His article is interesting reading, as it provides both pictures, one with the microscope partially disassembled, and an independent evaluation of Trekker functionality. Mr. Walker concludes,

This is an elegantly designed microscope, genuinely pocketable and gives informative images of suitable subjects. It's also good value at its discounted price of ca. £30. The 35x mag would perhaps best suit a naturalist seeking a higher mag than a hand lens can offer to study the smaller features of fauna and flora critical to identification in the field ... It's also useful for studying aspects of smaller aquatic and land invertebrates. ... The Trekker is less suitable for more general studies of fauna and flora in the field where the lower power of a 5x - 10x hand lens with its greater depth of field, field of view and more intuitive use would be better. ... The Trekker's eyepiece does act as a 10x lens and is a useful feature, although ... its short operating distance makes it a less versatile hand lens than a dedicated one.

--- (Walker, 2005)

Mr. Walker also notes, *at 35x the depth of field is inevitably quite shallow (< 1mm)*, and further observes that the microscope is best with relatively flat subjects.

A T-mount SLR camera adapter, that attaches to the microscope on one side and accepts an SLR's T-mount adapter on the other, is available. The T-mount option assures compatibility with almost any SLR. However, photographic images will not be up to benchtop quality, as resolution is likely at best to be about 4 microns.

For me, of the available microscopes discussed here, the Trekker, possibly because of its reduced 35x magnification, has proven the easiest to use.

Figure 14. Trekker

Figure 15. Trekker battery compartment (bottom) and object lighting (top)

The Trekker is easily mounted on a tripod, Fig. 16, using the tripod socket on the underside of the microscope, shown in Fig 15. This allows for steadying the microscope for use, or for photographs through the instrument.

Figure 16. The Trekker on a tripod with slide held by magnetic slide holder

A picture of the "feather" slide provided with the Trekker is shown in Fig. 17. As can be seen, the resolution is not high, but likely acceptable for initial screening use in the field, and for hobbyists.

Figure 17. Feather slide provided with Trekker

The Trekker evolved from the Enhelion Pico, Pico Peep 35, prototype platform, Fig. 18. Note the lack of a lighting arm that is present in the Pico prototype, but absent on the Trekker.

At roughly this time Messrs. Dickinson and Dunning started a new brand called "Looksmall". The website, www.looksmall.com, will be found printed on the underside of the Trekker.

Figure 18. The Trekker and its development predecessor the Pico. Courtesy, and with permission, of Rick Dickinson

There were thoughts of a stereomicroscope in the Lensman family, but that, sadly in the author's opinion, never went beyond the concept stage, Fig. 19.

Figure 19. Concept design only for a stereomicroscope in the Lensman family. Courtesy, and with permission, of Rick Dickinson

In a later paper, the Newton microscopes, Nm1-400, Nm1-400 XY, Nm1-600, Nm1-600 XY, and Nm1-1000 XY will be discussed in more detail. These microscopes are derivatives of the microscopes, discussed above.

These new Dickinson/Dunning folded-optics microscopes are targeted toward a user community of scientists and other professionals. The Newtons have considerably increased capabilities compared to, e.g., the Lensman and its derivatives. Not surprisingly, a side effect of this increased capability is increased manufacturing costs. This has resulted in the Newton microscopes costing considerably more than their less capable predecessors, and exceeding their originally estimated prices.

Roland Scal's Lecture, 03/27/16

An intriguing view into the hidden world of microscopical inclusions in gemstones. Superb imaging was accompanied by an enlightening and very interesting lecture. Some material was actually viewed at the new imaging station set up by John Scott. If one had not yet looked at gemstones and other minerals under magnification, Roland's lecture would have opened up a new door of microscopical interest.

***Book Your Hotel Today --
Room Availability is Limited***

Inter/Micro 2016

***An international microscopy conference.
June 6 - 10 at McCrone Research Institute, Chicago***

As the busy summer season approaches in Chicago, now is the time to reserve your hotel room for Inter/Micro 2016. The preferred hotels are the two Club Quarters locations in the downtown area. Click on the hotel name to reserve your room today:

Club Quarters, Central Loop

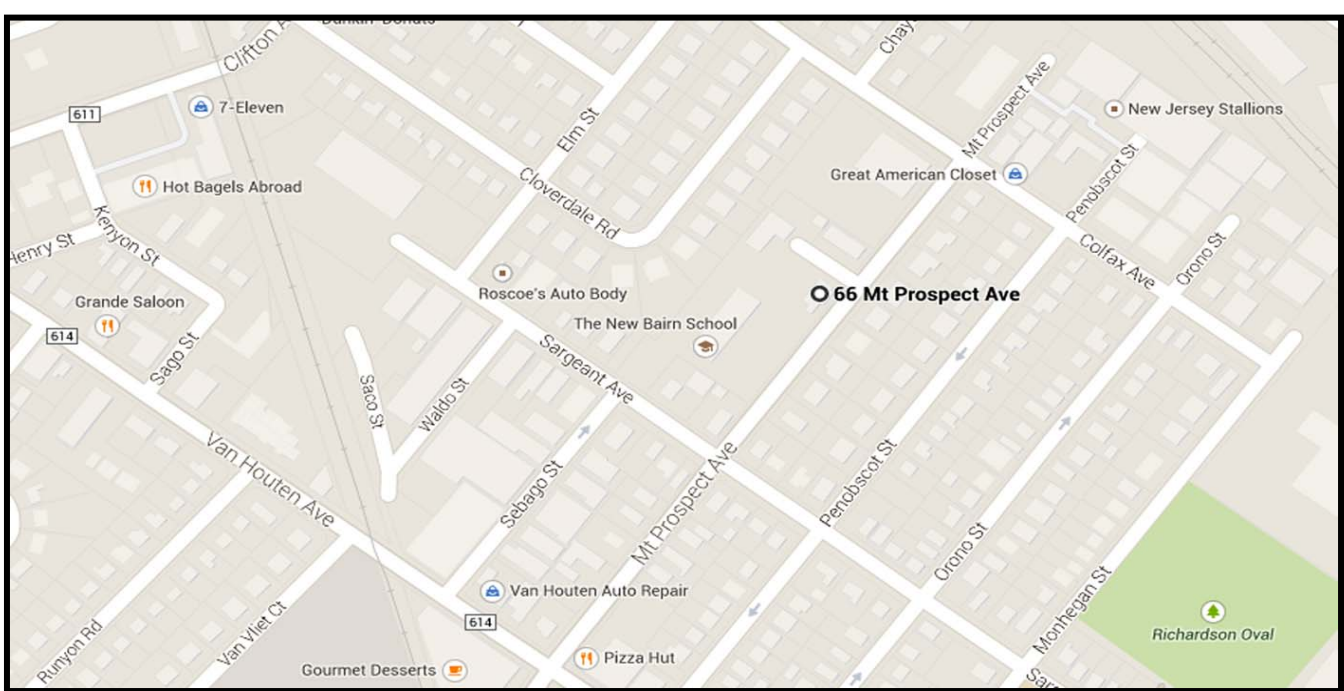

*111 W. Adams Street
3 miles from McCrone*

Club Quarters River Hotel, Wacker Drive at Michigan Avenue

*75 E. Wacker Drive
4.5 miles from McCrone*

To reserve a Club or Standard room for either location at McCrone's low member rates, including a \$20 daily transportation voucher, please call +1 312-214-6400 and tell them that you are an Inter/Micro attendee. View other [recommended hotels](#) and [register online](#) for Inter/Micro 2016.

Directions to NYMS Headquarters

**One Prospect Village Plaza
(66F Mount Prospect Avenue)
Clifton, NJ 07013**

**GPS: Intersection of Colfax & Mt. Prospect:
Latitude 40.8656 N, Longitude 74.1531W,
GPS: Our building: Latitude 40.8648 N,
Longitude 74.1540 W**

From George Washington Bridge:

Take Interstate Route 80 west to Exit 57A, Route 19 South. Take Route 19 to Broad Street and continue two lights to Van Houten Avenue. Turn Left. Go to second light, Mount Prospect Avenue and turn left. Building 66F is on the left side , one and a half blocks from Van Houton.

From Lincoln Tunnel:

Follow exit road to NJ route three west. Continue to Bloomfield Avenue exit. Turn right to Circle and go three quarters to Allwood Road West. Mount Prospect Avenue is a few blocks on the right (a small street) Turn right and go to first light (Van Houton) continue. Building 66F is on the left side , one and a half blocks from Van Houton.

From North:

Take Garden state Parkway South to Route 46 Clifton Exit. On 46 Make second exit to Van Houton Ave. Continue to third light Mount Prospect Avenue and turn left. Building 66F is on the left side , one and a half blocks from Van Houton.

From Route 46 coming from west:

Take Broad Street Exit in Clifton and follow Directions above from GW Bridge.

From route 46 coming from East: Take Paulson Avenue Exit in Clifton and follow to Second light, Clifton Ave turn right. Go to next light, Colfax, turn left, go three blocks and turn right on Mount Prospect Ave.. Building 66F is half block on right.

Public transportation from NY:

Take NJ Transit train from Penn Station to Secaucus Transfer Station. Change trains to Bergen Line to Clifton (call NJ Transit for schedules). From Clifton Station cross under tracks to first street and go left one block to Mount Prospect Street, turn right and Building 66F is one half block on Right.
